

Fossil Fuels are Noble Energy Sources

Reason Rising 2020

Some people are trying to convince you that fossil fuels are ruining the environment. That is not the truth.

For all of the hundreds or thousands of generations of people who lived before our time people cooked over a wood fire whereby they breathed toxic gases in the smoke. Fossil fuels allow for the **removal of pollution** from your home. Many people in other countries still breathe that smoke.

Fossil fuels are reliable. Millions of people get their heat, cook their food and drive their cars uninterrupted, day in and day out. Fossil Fuels nobly store their own energy. **Charging anxiety** and **range anxiety** are non-issues with fossil fuels.

Fossil fuels reliably provide for national defense. An army can only defend or advance on it's fuel. Battery failures or clouds over solar with the military could endanger that security. This also frees us from having to defend middle east suppliers.

With new, advanced technology in extraction, **fossil fuels are abundant.** We always knew there are hundreds of years-worth of fossil fuels in the Earth, but we couldn't economically extract them until recently. America no longer needs supply from other fossil fuel producing countries.

Fossil fuel extraction is minimally invasive, unlike strip mining for materials to build solar panels and batteries. Fossil fuels don't need to dig massive holes in the ground. And unlike mines, there is no child labor alleged in fossil fuel extraction. Of course, "clean energy technology" requires fossil fuels to build and operate.

Fossil fuels are relatively inexpensive. As compared to solar and wind, fossil fuels are much more **affordable.** One only has to look at the doubling and tripling of energy prices in California in their maniacal push for "clean energy technology". Environmentalists have stated they want to push energy prices higher so people stop using them. This will destroy the middle class and the poor will get poorer.

Fossil fuels are relatively clean, despite what you hear. Whereas firewood produces large amounts of toxic carbon monoxide, Nitrous oxide (NOX) which can produce acid rain and Volatile Organic Compounds (VOCs) of which many are toxic. Fossil fuels nobly produce **CO₂ which feeds the world** and is currently increasing greening on the Earth. Half the world still burns firewood with no pollution controls. Fossil fuels are much cleaner.

Fossil fuels produce trace gases that play well into the **recycling** ability of the earth. The Earth has always recycled well from wood smoke and the massive forest fires. Life responds after those fires, recycles and produces more life. Fossil fuels produce much less of those pollutants yet they still play into natural recycling.

100% percent of historical global disaster predictions have been wrong!

THERE IS GOOD IN THE WORLD
